

## MQP Meeting minutes

<b>Date and Time</b>	Tuesday 26, November 2013 at 2:00 pm
<b>Venue</b>	Craig's Office
<b>Participants</b>	Curtis, Craig, Krishna, Dan

Item	Notes and Discussion
Notes on the Demo	<ul style="list-style-type: none"> <li>• Could this be extended to dispatch entire HTTP requests to peer routers to speed up load times for typical web pages (Krishna).</li> <li>• Try to devise a more eloquent way to determine when to aggregate (perhaps a conditional GET on content length)</li> <li>• Monitor performance using tshark or tcpdump. (Throughput, )</li> </ul>
Trust Calc (Pt. 3)	<ul style="list-style-type: none"> <li>• Running trust calculation with a bit vector. Penalize recent activity more than past actions.</li> <li>• Good action adds a 1 to the front of the vector, bad actions add a 0. Divide by <math>2^{number-of-actions}</math>. Produces a trust value.</li> <li>• Highly reactionary. 1 sample (leading bit) will always determine 50% of the value.</li> <li>• Might work better for averaging past transactions, or for computing reliability.</li> <li>• What does trust mean? Accuracy, Timeliness (next to godliness), willingness, reliability. We're better off having a Pure Quality metric which lumps all of these metrics together.</li> </ul>
Determining when a response is false	<ul style="list-style-type: none"> <li>• End of the day, the response is either good data or bad data. How can we truly know? Zero Knowledge proof only works on static content.</li> <li>• HTTP headers (last modified date) might allow us to conclude when the server has responded with cached or out of date data.</li> <li>• A server is more likely to mess up with a response than the peer. Verifying data is a very difficult problem.</li> <li>• There will be many cases in which we can't verify the data. The heavier the analysis, the more overhead is introduced.</li> <li>• An accusation of lying will require a lot of work (Craig)</li> <li>• This was scoped more towards static content like movie files, we shouldn't have to worry too much about dealing with dynamic content.</li> </ul>
For next week	<ul style="list-style-type: none"> <li>• Excel timeline for upcoming work.</li> <li>• Revision of paper for Craig on Sunday (read it!)</li> </ul>
